Actual Jacobian transfers through a different product

2026-11-13 · N4 q223 / seed1 · unsigned / partial formalization

Prospective56fbbb precedes models and maps;52e030 precedes the reusable API addition. Native9722d7 uses a fresh checked SourceE and exactly matches ALL six original equations/H/Q/factors/kernels/P0s/whole quotient and rational-point records, then independently retains all135 product Lagrangians,4096 pairings and all9 rational kernels of Aprime:3product+6classical HLP. No private old instance is mutated.

All six actual target models are smooth; three have square D and three are nonsquare rejections. T values are95,168,203,119,215,138; D values182,12,126,120,95,201. Eligible(1,0),(1,1),(2,1) have P0s[1,0,84],[1,0,82],[1,0,75]. Full15-coefficient Moore descent, all three quotient identities, both geometric branches and actual origins pass. These are the classical HLP formulas, not a novelty claim.

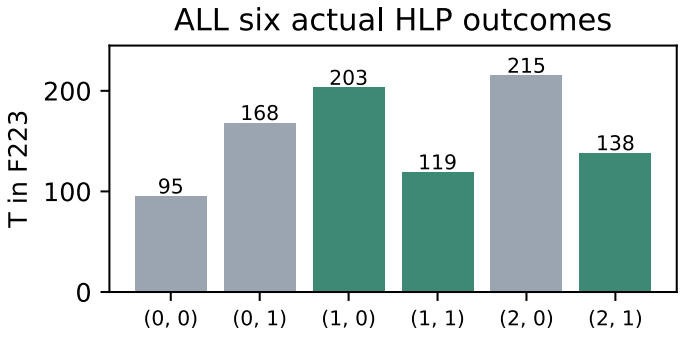

Native02/9561ce passes one unfiltered test/all2485 selected hashes unchanged. Every eligible target has complete PhiPrime/NormPrime, both new[2], actual F=PhiPrime gamma Nold and G=PhiOld delta NormPrime. BOTH[52] hold on every224 old and224 new rational curve-point class; all intermediate classes and source points are retained. Each also checks36 source points, nonzero exact-ell2773073 images and all five unchanged public targets.

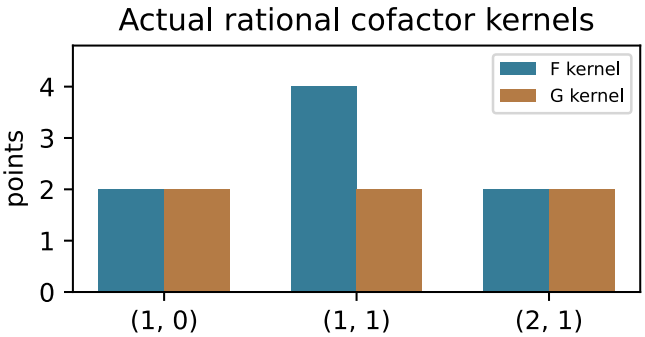

Written1fd6e7: global Ciani/V4 quotient correspondences give the dual[2] pairs, degree8 and polarization2; actual Res(gamma)/Res(delta) give both[13] and degree13^3. Scalar commutation yields GF=FG=[52], degree8*13^3*8=140608 and polarization52. Characteristic223 is coprime to52. Actual scheme/Picard/Galois/duality/degree interpretations remain written, with partial formalization. Finite panels support this argument and do not replace it.

The actual source and target elliptic j-conjugate sets are disjoint, so their canonically polarized products differ by the degree-one-column argument. If a new Jprime were F223-ppav-isomorphic to old J, its norm would transport a rational maximal-isotropic2-kernel to old J. The earlier unique-kernel result would force Aprime isomorphic to A, a contradiction. Each of the three actual endpoints differs from old J over F223. Mutual new-target and extension-field Jacobian isomorphisms remain undecided.

Executable source recovery and retained kernel outcomes

For the original elliptic DLP define H(P)=F(PhiOld(P)); then delta NormPrime H(P)=[52]P. Exact52*159985=1+3*ell gives actual odd-source recovery159985 delta NormPrime. The reusable Chain API provides F/G and tagged original-source forward/recovery, with explicit source/target/field/order, odd membership and forward roundtrip checks. All five public manual/API images and recovered original points agree; runtime takes no known scalar.

All01 complete-map checks remain in02:100Phi+100Norm addition pairs each,48 alternate charts, all224 equal geometric line offsets, true multiplicity3 norm-omission control, all12 dual-number doubled-fibre versus wrong-linear checks, signed geometric infinities2+2, reachable K infinities, actual alternate P0 tags/zero origins and off-curve rejections. New controls reject two foreign translated-conjugate source A/B rows, an actual mismatched chain target, noncanonical/nonodd source, nonodd classes and wrong tags. Whole01/e1e62b remains preserved.

All three rational cofactor groups are C4. F has rational kernel sizes2,4,2; G has2,2,2. These observations do not classify the full geometric kernel or establish cost advantages. The specific next algebraic question is the transported Gold intersection on Aprime[2] via the actual gamma permutation[0,3,2,1], together with the13-primary factor, before labeling free(52,52,52) kernels.

Two faithful exact Lean bindings4d1338/95d4e6 pass both unchanged original4.35/4.34.1 gates:both global Jacobian52 and original-point52 compositions, derived from genuine dual2/source13 pairs and explicit scalar action/commutation laws. Neither52 conclusion nor an inverse is assumed. Two audited,zero trusted,no axioms;52 accumulated local bindings. Actual geometric interpretations remain written/open. First producer c4ffa9 redundant-rfl build failure is retained; only those tactics were deleted, statements unchanged.

Odd-source published3de8c174 is settled:independentfullb2b04d/all640 guards/13phasepairs/four actual admission controls;TEN-workflow CI5fee41/all84 native50 canonical digests match. New models/maps/proofs/ report need source checkpoint and strict independent clean replay/CI. Nine new whole closed captures and both complete large map fixtures are queued for the unchanged genuine publisher; no raw data splitting, pruning or threshold change.

Original S3 benchmark checkpoint/live budget/capacity, complete transport/cold+online costs and strongest IC/rho references remain required for computational advantage. No performance ratio is reported. Earlier alternative-gluing/kernel/odd-source diagrams were checked and remain correct; new graphs add the actual different-product52 route and executable source recovery. Exact curve equations/P0s/model IDs are in identities.json; full native records remain under their catalogued immutable evidence paths.
