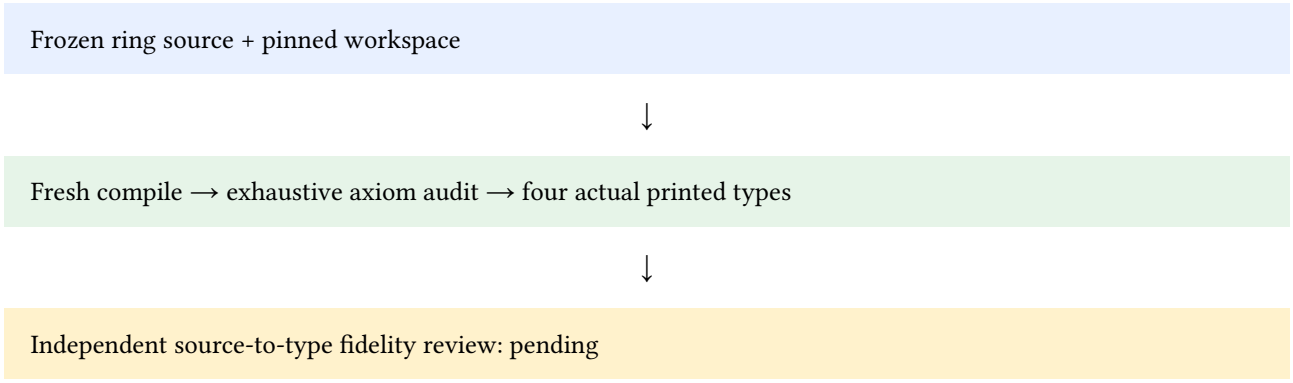
Known-label native type evidence

29 October 2026 · T-790 · PR 1289

Observed

Hosted run 40828001123, attempt 1, succeeded at native checkout 2e5184f9febb (producer head 42fb95ed95a6). The artifact digest matches GitHub. Its 221 retained records bind 217 successful commands. These are custody counts, not counts of independently validated scientific results.



What passed

The exact named compile, audit and type commands returned zero. The audit covers four theorems with zero failures and zero trusted exceptions. Source, auditor, collector, workflow and project pins match between the PR head and native checkout. Original proof bytes are unchanged. Large raw artifacts and the sealed 840-file repair review use the repository artifact store.

Remaining boundary

The compiled object digest is recorded; its bytes were not retained. Lean/Lake, dependency binaries and runner integrity remain trusted. Boundary hashes do not exclude transient edits. Native type correspondence requires independent review. Graph, elliptic-group, probability, performance and historical execution claims remain outside these ring identities.

Evidence

NATIVE-STATUS.md; native-40828001123/binding.json; head-native-input-comparison.json; named-records/; .artifacts.json; repair-review/repair-review-package.json. Prior reports and reviews remain unchanged. Full historical validation remains open.
