Complete F101 C0/T20 coordinate adapter

Independent unit c37d26 · frozen protocol8f3da8 · unsigned

All 12,317 independently enumerated C0 classes AND all 12,317 independently enumerated T20 classes pass both inverse directions,distinct valid images,both public routes,group/Frobenius and all 109+113 scalar images/exact orders. This evaluates the accepted global degree 196 chain through its SAME norm diagram and injectivity. It does not independently reconstruct R20. [pcc:unverified]

C0 is y²=z⁶+6z⁴+13z²+56. Its degree 2 covers target E0:Y²=X³+X+46 and F0:Y²=X³+44X+21. The unchanged T20 covers target E2:Y²=X³+59X+27 and the same F0. Original SevenEdge supplies the two nonbacktracking normalized 7 maps and positive dual. No new arithmetic engine is introduced. [pcc:unverified]

C0 image-Mumford norm agrees with an independent F101² pointwise oracle. Both compositions are [2],cross0,with recovery6159 or component55/57. Pole support counts are[0,238]. Runtime takes no support roots,extension context,class index or DLP label;existing factory/setup validation remains charged. [pcc:unverified]

Complete fibres and nonuniform recovery

Each degree 2 pullback retains the ORIGINAL scheme $U=n-Xq^2$ and ordinate V modulo U. Its infinity multiplicities satisfy d+nplus+nminus=2;the old balanced reducer receives plus=nplus. This differs from the old T20 degree 4 plus=nplus−1. [pcc:unverified]

Cover	All rational fibres	Exceptional points
E0 /109	1O +108 degree 2;2 repeated	(2,±37):$U=z^2$,V=±37
F0 /113	1O +110 degree 2 +2 degree 0	(38,±56):U=1,empty V;two signed infinities,plus2/0

All 222 elliptic points are checked. Squarefree replacement loses a ramification multiplicity;wrong infinity accounting changes the degree-zero class. Both selected replacements in each category are VALID BUT DIFFERENT classes,not malformed rejects. [pcc:unverified]

The forward route is PT diag(55,57)diag(alpha49,id)N0. The inverse is P0 diag(104,85)diag(beta49,id)M. Alternate public norm-inverse routes agree everywhere. Canonical F†F has norm components [98,2];the RAW reverse composed with F has [196,4]. Thus reverse factors104/85 differ. These rational inverses are not global inverse isogenies. [pcc:unverified]

Whole-domain negative control	Different	Equal
Omit forward half →2F	12316	1
Use 104 in both reverse components	12208	109
Use 85 in both reverse components	12204	113

Wrong first 7 backtrack endpoints fed as E2 inputs:106 rejects and2 valid different outputs among108 nonzero E0 points. The selected reciprocal ordinate-sign mutant is valid but different and fails inverse recovery. All 20 fixture mutants plus domain/canonical/foreign-model/size controls reject. Coherent whole-cover translation is a positive norm-invariance control. [pcc:unverified]

CLI d22bca admits the fixed fixture and checks 36 bounded fibres including duplicates;it does not supply exhaustive acceptance. The four tests supply BOTH 12,317-class domains. No arbitrary extension-Jacobian input support or computation advantage is established. [pcc:unverified]

Proof,evidence and remaining integration

Eleven exact Lean declarations include actual characteristic101 cover equations and special fibres,balance/constants/nonuniform recovery,conditional norm uniqueness and BOTH conditional inverse directions. Main 4.35 gate:11 compiled / zero trusted;additional consumer4.34.1 exact PCC bindings:11 local pass / zero trusted. Actual curves,Picard/completion/reducer/chain normalization and joint injectivity interpretations remain written/native bridges. Formalization is PARTIAL. [pcc:unverified,e9bf81]

First binding01 fails with incompatible olean header;forced4.35 attempt02 fails the older auditor's removed APIs. A compatibility addendum was frozen before03,which compiles and audits the SAME source with the existing consumer4.34.1 validator. No verifier or trusted-axiom allowance changes. Original failed verdicts/diagnostic logs remain;the original failed claim is reused unchanged. First Clippy 101 original imported-module warning is also retained;new-wrapper compatibility attribute alone fixes it,and strictClippy02 passes. [pcc:unverified]

Unit original01:50:50Z→01:57:32Z/tests0/guard0/all784 input hashes unchanged. Its COMPLETE794-file source/log/receipt tree is one 2412572-byte standardtarXZ,SHA8ec2a0e4… . CLI COMPLETE795-file tree is2412084/SHA26c3048e… . Every member/raw/archive hash and exact roundtrip is retained;native caches are separate. Correctness durations are not performance measurements. [pcc:unverified]

Trusted-base43350144819/job131638964432 ACTUALLY replays TWO whole remote objects before normal botcee9a5e174011c1a98d5e0eefd5007cbf8c555b2. Exact localFF0/artifact0/correct wiring02pass0. Whole425873-byte UTF8 log/XZ43320 plus whole publication tree/XZ56640 are retained. The canonical manifest is at immutablecee9,under evidence/fp-chain-whole-archive-hand-off-01. Original unit claim's exact archive path uses the genuine published object entry,with narrow PCC gate/sign hydration. Followup no-op is not upload proof. [pcc:unverified,953892]

First wiring caller used a nonexistent path and returned2;correct existing command passes separately. A custody caller ran before its asynchronous receipt existed and stopped before mutation;the original receipt unblocks it. These caller errors are preserved,not mathematical failures. [pcc:unverified]

Old 50 non-workflow inputs and all FIVE whole jobs/16651-byte prefix remain unchanged. A distinct sixth job/new strict driver is drafted. Admissions,full55-minute all-old-plus-new replay and own six-job CI remain PENDING at this unit checkpoint. Root927 is pinned in a clean sibling upstream worktree while root metadata advances. No gate is waived. [pcc:unverified]

REPORT.md links original claims/raw custody,written proof,compatibility addendum,fixture/primary sources and editable DOT/SVG/count data/renderer. Galbraith corrected8.3.8/8.3.10 and actual old engines were read. KB127 supplies no novelty inference. Canonical earlier diagrams remain current;no cost/catalogue/timeline edge changes. Next finish integration and continue the next unblocked task. Live budget/checkpoint access still gates experiments. No speedup or ECDLP solver advantage claimed. [pcc:unverified]
