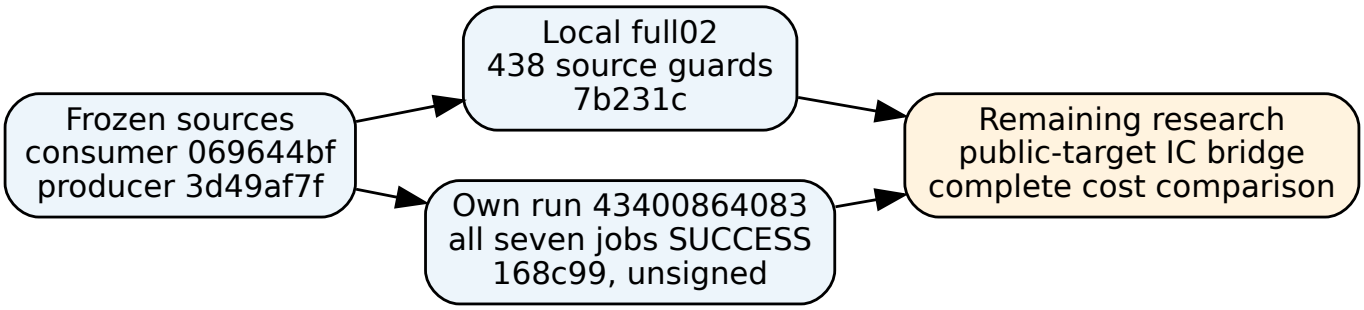
Canonical norm: exact-source CI receipt

2026-11-13 · all standing unsigned · no cost claim



Observed scope, 168c99 (unsigned): all seven terminal jobs in the exact-source run completed successfully. The new canonical-norm job 131803082298 contains 36 native JSON records, all equal to the original accepted 12 consumer and 24 producer records. All 24 exact original PCC verdicts pass; claim IDs, commits and canonical digests agree using the unchanged original PCC claim_digest function.

Independent local full02, 7b231c (unsigned): exact clean consumer069644bf / producer3d49af7f; all 438 outer input guards unchanged; all 23 outer and 20 nested producer native/tee pairs return zero. These are phase pairs, not 43 independent mathematical tests. Both original norm proof gates audit 13 declarations with zero trusted declarations. Actual algebraic-geometry bridges remain written/native.

Custody: raw02 is one whole 790,964-byte standard tar/XZ archive with 471 files, every-member hashes, raw/archive hashes and an exact round trip (8f9f11). All seven whole logs and API responses, dispatch/discovery, 438 source snapshots and the collector are retained. The prior partial 134,968-byte raw01 remains immutable (d82dd3). Remote availability is a separate actual-publication receipt.

Preserved failures: the first collector compared canonical claim hashes with raw pretty-JSON file hashes and stopped. Frozen b15b45 precedes the bookkeeping correction; no native source, theorem, verifier or acceptance criterion changed. Optional artifact ZIP access received storage-proxy403 (963670); zero ZIPs downloaded. Exit/guard observations derive from the unchanged driver success marker and successful job step; standalone job-artifact exit files were not downloaded.

Next and limits: CI is settled; no re-poll or re-dispatch. The existing N4/B2 destination solver has a planted-target API and a q mod 12 = 7 field restriction. Add a public-Q interface and explicit field/model/basepoint bridges under a new pre-code protocol. Preserve the withdrawn subgroup-enumeration result. No measured computational advantage or signed execution/full-geometry verdict is established. Main merge and authentic root-fixture access requirements remain open.
