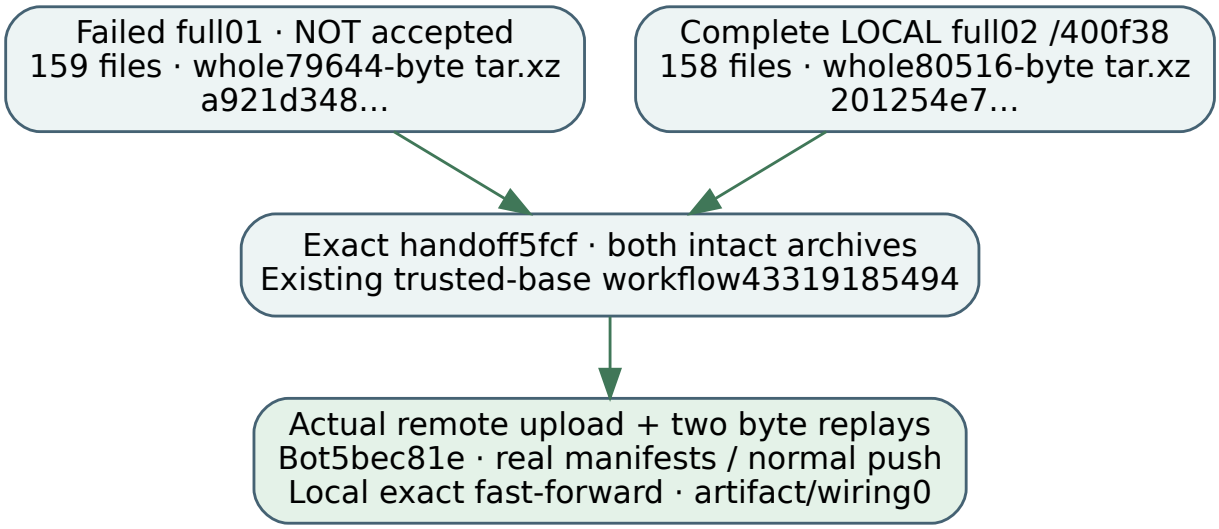
Proper replay archives: publication addendum

2026-11-12 · actual trusted-base migration · unsigned

Both complete original raw archives were uploaded and replayed by the existing artifact-autofix workflow. Exact bot5bec81e36ac9b6f7b91ddc5437766248bf7aacfe adds real manifests/ignore and removes only these two tracked archives. The local branch fast-forwards to that exact bot commit. [pcc:unverified]



Run43319185494/job131535060041 succeeds. The whole log explicitly records two remote objects replayed before the normal push. Its entire425602-byte UTF8 output is preserved as standardXZ with raw/archiveSHA256 and exact roundtrip. Actual artifact and workflow-wiring checks both return0. The manifest’s complete hashes match both intact local originals. [pcc:unverified]

This addendum supersedes only raw-publication-pending status. Failed01 remains NOT accepted;complete full02/400f38 remains LOCAL acceptance. Original reports,claims,custody,receipts and source snapshots remain immutable. No tree was split/pruned,no policy/bypass label changed,and the previous no-op job is not used as upload proof. [pcc:unverified]

Sources:REPORT.md links the full job/API/custody,canonical manifest at immutable crypto5bec81e,exact full hashes/content-addressed S3 keys, original handoff and documented docs/artifacts.md mechanism. Consumer PR1517 links these canonical objects;its old three jobs remain unchanged. These archives are report evidence,not runtime replay inputs. [pcc:unverified]

The diagram shows custody flow,not a cost comparison. Prior scientific graphs/IC timeline/scoreboard stay unchanged. No new mathematical claim, benchmark,leaderboard row or scientific signature follows. [pcc:unverified]
