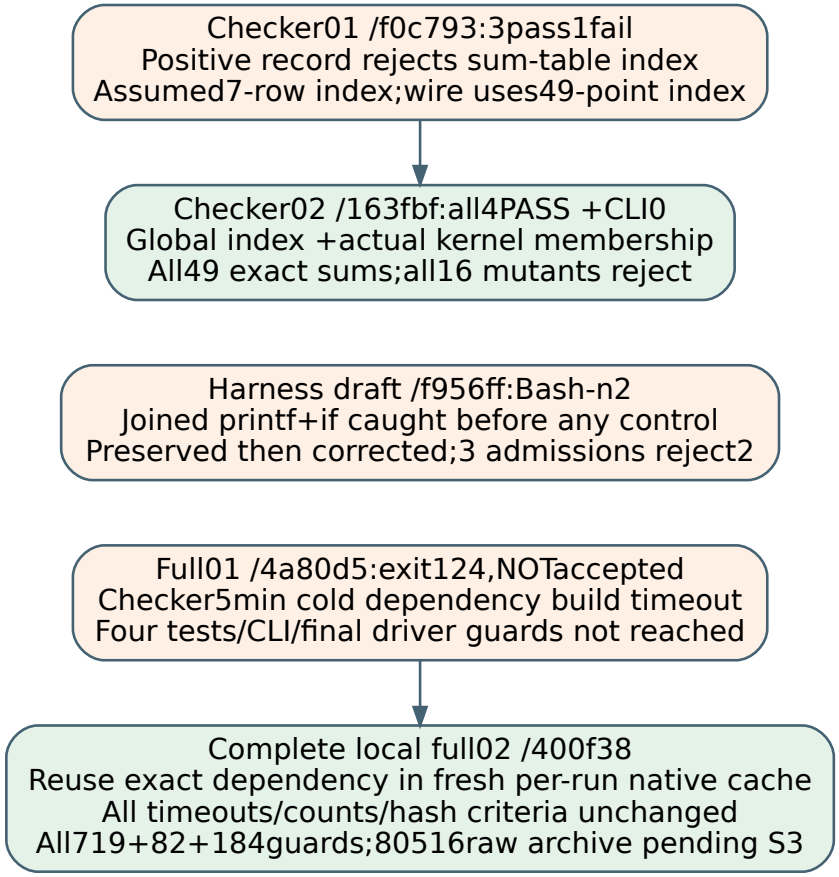
Retained kernel-checker and replay failures

2026-11-12 · protocol75eacc · unsigned · full02 locally complete



The first two failures are implementation/temporary-shell errors;full01 is a bounded cold-build failure. None proves a mathematical obstruction. Original records and acceptance criteria are retained. [pcc:unverified]

Checker01/f0c793 passes3 negative-control tests but fails the positive record. The actual native table stores indices in the full49-point E7 list. Checker02 uses the global index,requires actual kernel membership, and checks all49 actual Cantor sums. All four tests/16mutants/CLI and 183 guarded hashes pass separately (163fbf). A negative test’s pass while the positive baseline fails is not complete verifier acceptance. [pcc:unverified]

Harness draftf956ff has a joined printf+if line,caught by Bash-n2 before any controls run. Its source/diagnostic/status are preserved. After correction, wrongHEADc7,modifiedgeometryJSON and missinggrep reject2 before outputs (a5bf9e). Initial sparse checkout0 warns of an unavailable unselected historical backlog blob;selected source hash closure is still required. [pcc:unverified]

Full01/4a80d5 completes native41/algebra23ten/bothJSONcmp/39proofmodules 224compiled198written0trusted,then checker5min expires during existing engine release compilation. Four checker tests,CLI and final driver guards do not run. Original outerexit124/finish and183afterhash0 are retained; late719upstream/81consumer hashes pass and are explicitly late. Full01 is NOT accepted. Whole159-file79644-byte standardtar.xz is intact, over64KiB policy and pending real S3 upload/replay;no evidence is pruned or split and no pointer is invented. [pcc:unverified]

Additive71036e reuses the exact same engine fingerprint from the fresh isolated per-run native cache. All30/15/10/5minute bounds and scientific acceptance stay fixed;full02/400f38 completes every original criterion and all719+82+184guards. Its whole158-file80516-byte archive is intact, also pending S3 publication. Root trusted-base artifact-autofix is the documented route6b43e2;its prior run was a no-op,clarified by root3eeb2e, so real new upload/replay/manifests remain required. LocalLinuxx86_64 development,Rust1.99.1/Lean4.35.0,no cost measurement. REPORT.md links every original source/log/status and the editable visual. [pcc:unverified]
