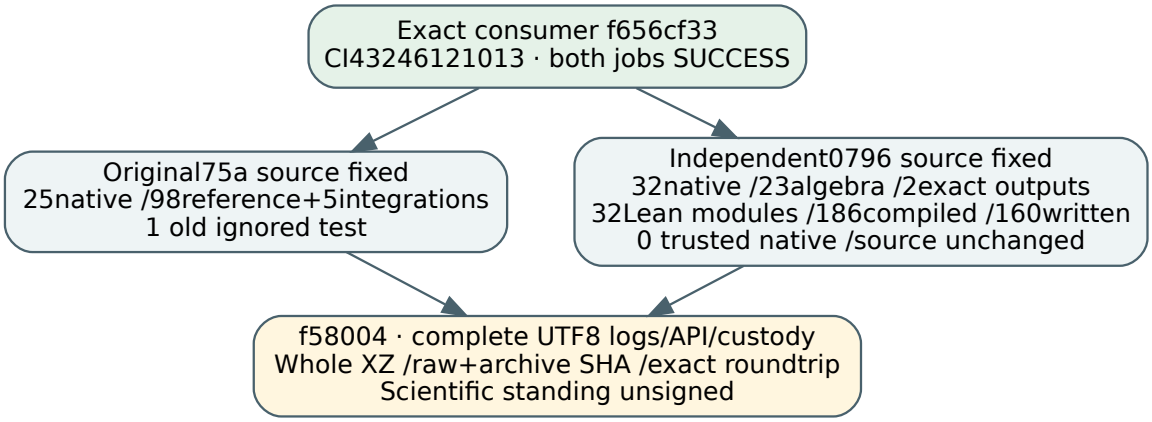
Exact f656 consumer CI succeeds

2026-11-12 · run43246121013 · complete two-job input closure



Both complete jobs succeed on exact f656cf33236329c20696e0cb0a49fc74e0263950. Receiptf58004 retains the original25/98+five/oneoldignored and the independent 32/23/two exact certificates/32Leanmodules186compiled160written0trusted, with unchanged source. The diagram records coverage,not timing. [pcc:unverified]

Resolved runner input gap

Portable grep/glob parsing and explicit preflight now satisfy both local no-rg04/22ad5d and exact CI. The original13Rust/check.sh/75a pin and independent0796 pin remain unchanged. The input-closure problem is resolved at this scope;scientific signing,ledger/C merges and costs remain separate. [pcc:unverified]

Complete logs and preserved failures

Reference job131279117014:249035 UTF8 bytes→standardXZ30776. Independent job131279117478:110929 bytes→XZ17424. Both whole logs have raw/archive SHA256 and exact roundtrip;run/jobs API and custody accompany them in evidence/ci-f656-success-01. Byte counts use the actual encoded files. No truncation or log splitting is used. [pcc:unverified]

Failed8fCI43232186220/55e8da and its earlier inspected report remain intact, as do missing lockfile/JSON attempts and all admission negatives. ExistingV2 describes the earlier local checkpoint;this additive report supplies its later exact-CI outcome without changing frozen evidence. [pcc:unverified]

Sources and continuation

Sources:V4 protocol,exact driver/workflow/pins,actual failed/successful logs, and retained no-rg04. KB unavailable;exact repository evidence is the fallback. INDEPENDENT_REPLAY_CI_SUCCESS.md links the full receipt and problem resolution. Future integrations require a new protocol and immediate stack parent;do not re-poll this settled head. No new native/criterion/pin change, benchmark or scientific signature is supplied by this receipt update. [pcc:unverified]
