

cold segments C1..C20: one fresh pinned process per arm on new point s$(i-1)$ (role rankprobe-cold-v1)

cR	**cP**	cPl	rT
rank cut (baseline)	candidate cold	+ lift index build	tuned rho

rank blocks K1..K4 (new seeds 301..304): same 600 attempts in every arm; table must equal B's

kR	**kP**	kPaa	kPX
rank-cut loop	frame loop	A/A	planted: rank-cut keys redone

Primary (frozen):

$$R = \frac{\overline{\text{rank}}(kR) + \overline{\text{cold}}(cR)}{\overline{\text{rank}}(kP) + \overline{\text{cold}}(cP)} \quad \text{(end-to-end cold)}$$

improvement iff 95% lower bound > 1; bootstrap: blocks, then attempts paired within a block, and points.
Gates: per block one relation digest, one per-attempt probe vector, one root-call count and one set of point-addition counters across kR, kP, kPaa, kPX.
