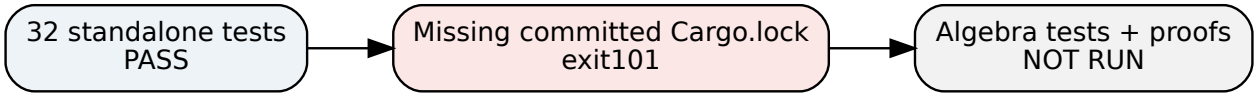
Failed isolated replay01

2026-11-12 · crypto16c9927b · unsigned correctness integration

All32 standalone tests passed. The complete replay exited101 at cargo fetch –locked. Algebra unit tests and the proof gate were NOT RUN. This is a source input closure failure, not a failed mathematical assertion. Claim56d812. [pcc:unverified]



The diagram records executed stages; there are no comparable performance arms, isolation claim or solver measurements. [pcc:unverified]

Exact failure and correction

The already tested lockfile was globally ignored and absent from Git. Commitdd03 tracks the exact tested2,888-byte Cargo.lock with a package ignore exception. No dependency version, native code or test criterion changes. [pcc:unverified]

The next attempt executes the complete unchanged acceptance again. The first and second failures remain immutable; accepted replay03/db5e8a at0796 is a separate checkpoint and does not replace this evidence. [pcc:unverified]

Raw custody and source integrity

The whole14-file raw tree is preserved as one40,092-byte standard tar.xz, with every raw file’s SHA256, transcript, source snapshots, before/after guards, status and exact roundtrip. Raw evidence: ../../evidence/ independent-failed-01/custody.json and raw-tree.tar.xz. The run’s frozen protocol and source pin remain archived. No filtered criterion or test was removed; –locked stays required. [pcc:unverified]

Sources checked: the repository’s frozen protocol, exact native/checker source and literal imported inputs. KB MCP is absent and the wrapper unavailable; fallback review is limited to those sources. Read ../../INDEPENDENT_REPLAY_REPORT.md for the three attempts, original reference98 preservation and reproduction. The upstream mathematical graphs remain current; this report updates only source closure and execution flow. [pcc:unverified]
