Fixed binary source-kernel certificate; no constructed Jacobian or evaluated transfer
Fixed E over K=F_512, modulus 515
b=24; constants a=0 and a=1
Source trace classes already recorded locally
L=K[u]/(u^2+u+1)
Actual independent three-torsion P,Q
F_512(P)=P; F_512(Q)=-Q
Numerical Weil pairing u or 1+u
Three actual tuple generators in the conjugate product
27 geometric kernel points; 3 individually rational
All 729 additions close; all 729 product pairings are 1
Frobenius-stable; zero coordinate intersections
A rational (3,3,3)-quotient exists by the proved criterion
Source-coordinate kernel obligation is now checked
The particular Jacobian twist remains unselected
unimplemented target/map step
Still required: binary quotient reconstruction, twist character,
explicit isogeny evaluation, planted-log replay and priority audit
No new weak-curve catalogue row or cost claim
