Current cryptanalysis Lean corpus evidence

24 October 2026. Source-bound audit based on cryptanalysis main `9d320ae7df3b8aa15d4497d6895f63644daa92d5`, with two additional GLV axiom print directives in this PR. The authoritative machine-readable evidence is in `receipt.json` and the full scope statement is in `report.md`.

Figure 1: Tracked research Lean files with native proof-build evidence. This is a file inventory, not a percentage of historical experiment claims.

Method and result

The October 21 native corpus audit compiled 93 files. At the current head, 91 of those files have identical SHA-256 bytes and unchanged effective Lean toolchain pins. Two revised Orbit files pass `lake build` and exact axiom output for three public theorems. One new GLV theorem file passes the pinned C-selector source binding and reproduces a corrected eight-theorem Lean receipt. Two public theorem axiom printouts were absent from the prior receipt. All fresh theorem axiom sets contain only `propext` and `Quot.sound`. The historical generic gate's real imported-file probe failed because it did not build a local prerequisite; the replacement CI check uses the exact corpus bridge and fails closed on a new source or pin.

Limit

These are 94 research-file build-evidence rows, with 91 inherited by exact source and pin equivalence and recorded prior axiom checks. They do not exhaustively audit every declaration's axioms or verify that every theorem matches its research claim or that the historical experiments executed as recorded. A claim-to-theorem-to-run matrix remains open. No curve, benchmark, or performance result changed in this audit.
