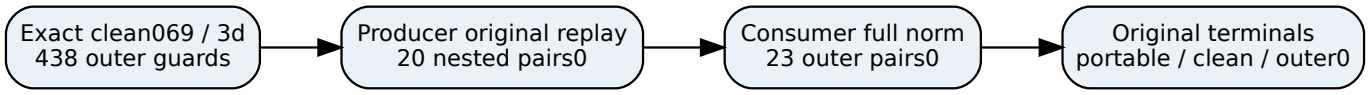
Canonical norm: complete independent replay

2026-11-13 · additive integration receipt · all standing unsigned



Corrected independent full replay7b231c is COMPLETE:exact scientific consumer069644bf and producer3d49af7,clean isolated physical Cargo siblings. Original09:26:05–09:33:59UTC,native/driver/portable/cleanliness/outerguards0;all438 outer inputs unchanged (437 portable inputs plus the exact producer reference control). ALL23 outer and20 nested producer native+tee pairs are[0,0]. This is a local correctness replay;the interval is not a performance comparison. [pcc:unverified]

The producer dependency completes four native tests,nine CLI points,two original proof modules and11 exact PCC bindings. The consumer completes four full-group tests,nine CLI classes,two original proof gates on the same13 declarations and13 exact bindings. Every12 consumer native JSON record equals accepted unit02 75275f;every24 producer record equals c162f3. Three consumer CLI golden outputs are byte exact. Original producer and consumer arithmetic,statements,validators and trust manifests are unchanged. Actual geometric bridges remain written/native;formalization is partial. [pcc:unverified]

First full01 3b2d52 exits1 after strictClippy0,before producer tests because the isolated sparse layout omitted reference-02.sha256;all437 outer hashes and cleanliness stay unchanged. Frozen ee1b81 precedes adding the EXACT existing3d Git blob. The first sparse helper uses unsupported git add flag --no-cone (129),then its caller cannot find prepare02 (127);3669c0 retains that preparation failure. Corrected existing noncone command succeeds without a source edit. Four admission controls return2/no output on both full attempts;all exact sources are restored before the full runs. No criterion is weakened. [pcc:unverified]

Whole original full01 has489files in668,940-byte standard tar/XZ;successful full02 has590files in676,560 bytes,345e25. Each includes complete selected-source snapshots,commands,environment,stdout/stderr,original exits,member/raw/archive digests and exact roundtrip. Build caches are outside raw. Both whole archives use the existing trusted publisher,d44f21/source923fdb44;actual migration43403906430 is discovered success,whole terminal job receipt and genuine consumer manifests are retained separately. Earlier SIX native raw archives are actually published48e581/7cd6ea. [pcc:unverified]

Own CI43400864083 on exact069 initially has allSEVEN jobs in progress,new job131803082298,next scheduled check10:16UTC. The entire old20,796-byte SIX-job prefix is unchanged. A pending CI is not a pass. The09:45 routine GitHub snapshot finds root3877 open/mergeablefalse/no returned reviews or threads;stacked1521/1520/1519 remain ready open and unmerged. Root broad regression still lacks its authentic ecbench fixture;AWS credentials absent and anonymous exact-object read403. Main ledger/signing/conflict/review gates remain separate. [pcc:unverified]

Next:finish actual raw/checkpoint publication and exact-head CI receipts,then integrate the existing destination solver. Primary-source review identifies N4/B2 as an existing end-to-end target-descent implementation;its current API accepts a planted scalar and its field constructor requires q=7 mod12. The old q≤11 subgroup-enumeration smokes were withdrawn as IC evidence. Reuse original algorithms with explicit public-target/model/base-point bridges;do not repeat the withdrawn route or infer new timing from legacy reports. Any charged comparison still requires actual admission and matched complete references. No new measured computational advantage. [pcc:unverified]

Source-linked evidence

evidence/g3-norm-full-acceptance-02/summary.json;g3-norm-full-01/custody.json;g3-norm-full-02/custody.json;g3-norm-full-layout-correction-01;g3-norm-sparse-helper-failure-01;g3-norm-source-launch-01. The earlier3-page native report and its editable data remain immutable. General-chart invariance is written;native alternate choices remain eight typical classes per field.
